[図8]

Fig. 8

[Fig. 1]

A1: position command or speed command

[Fig. 2]

A1: simulated disturbance torque

A2: speed command

A3: load

[Fig. 3]

A1: speed command

A2: speed

A3: torque

A4: amplitude by vibration during operation

A5: time

[Fig. 4]

A1: control gain

A2: simulated disturbance torque

A3: torque or speed

A4: vibration detecting level

A5: maximum gain (record a value just before vibration)

A6: time

[Fig. 5]

step 1: detect amplitude by vibration of machine during

ordinary operation.

step 2: apply simulated disturbance torque.

step 3: Is vibration detecting level exceeded?

step 4: raise control gain.

step 5: apply simulated disturbance torque.

step 6: Is vibration detecting level exceeded?

step 7: lower control gain after maximum gain is extracted.

A1: start

A2: end

A3: adjustment of simulated disturbance torque and vibration detecting level

A4: extract maximum gain.

A5: increase simulated disturbance torque.

[Fig. 6]

A1: speed command

A2: speed

A3: vibration is liable to arise in such a position

A4: time

A5: speed command and speed

A6: gain

[Fig. 7]

A1: speed command

A2: speed

A3: control gain  
A4: greatly vibrate  
A5: control gain is excessively raised.  
A6: already oscillated in this neighborhood

[Fig. 8]

A1: position command or speed command
